

CLOSE ALL OPEN PROGRAMS FIRST

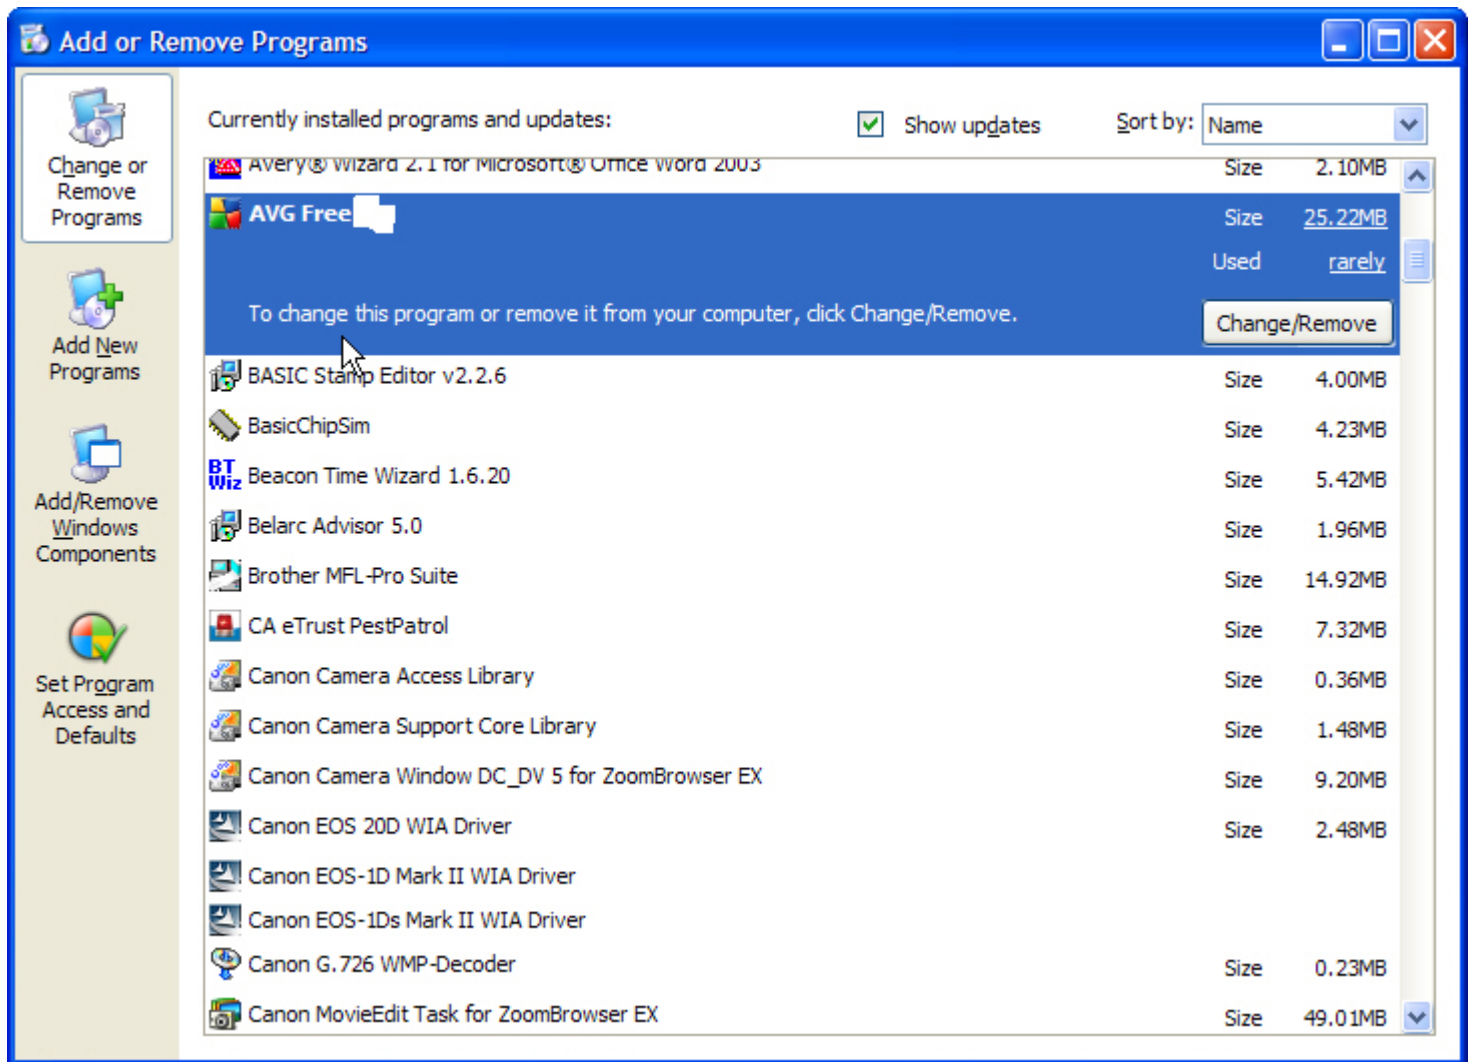

Before installing the new version of AVG (Version 8.0) you must uninstall the old version. Immediately below are directions to do that removal. Once you have removed the older version be sure and reboot your computer before starting the install of the new version.

Got **Start** then click on **Control Panel**

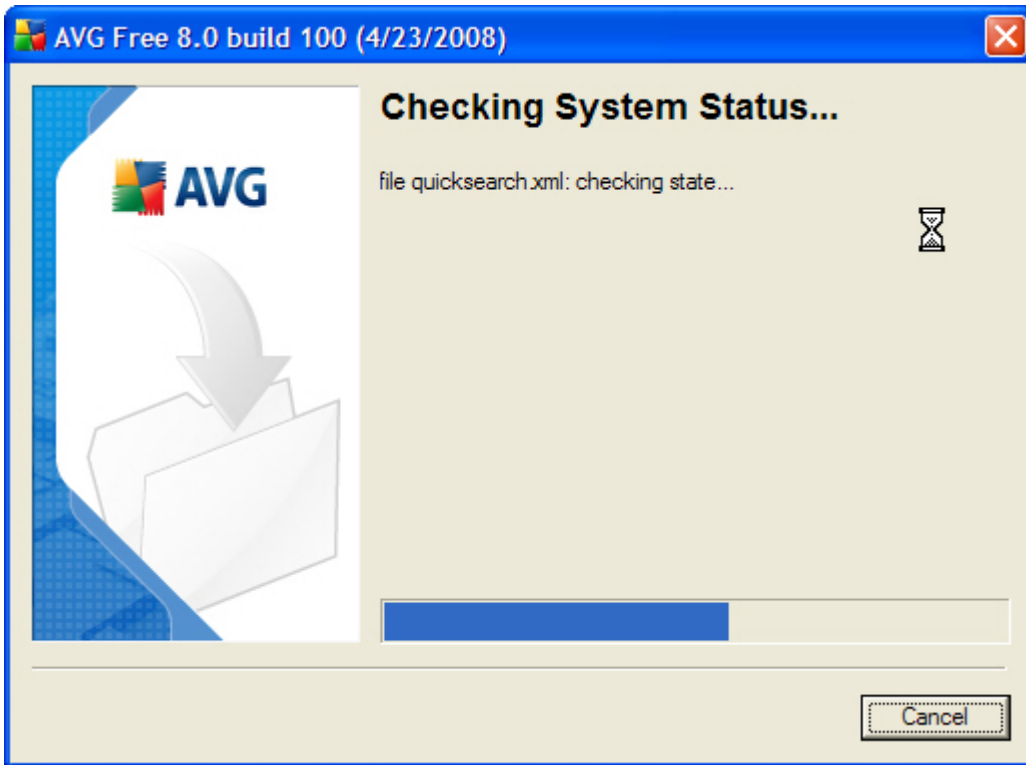

In the list on the next screen pick **Add or Remove Programs**

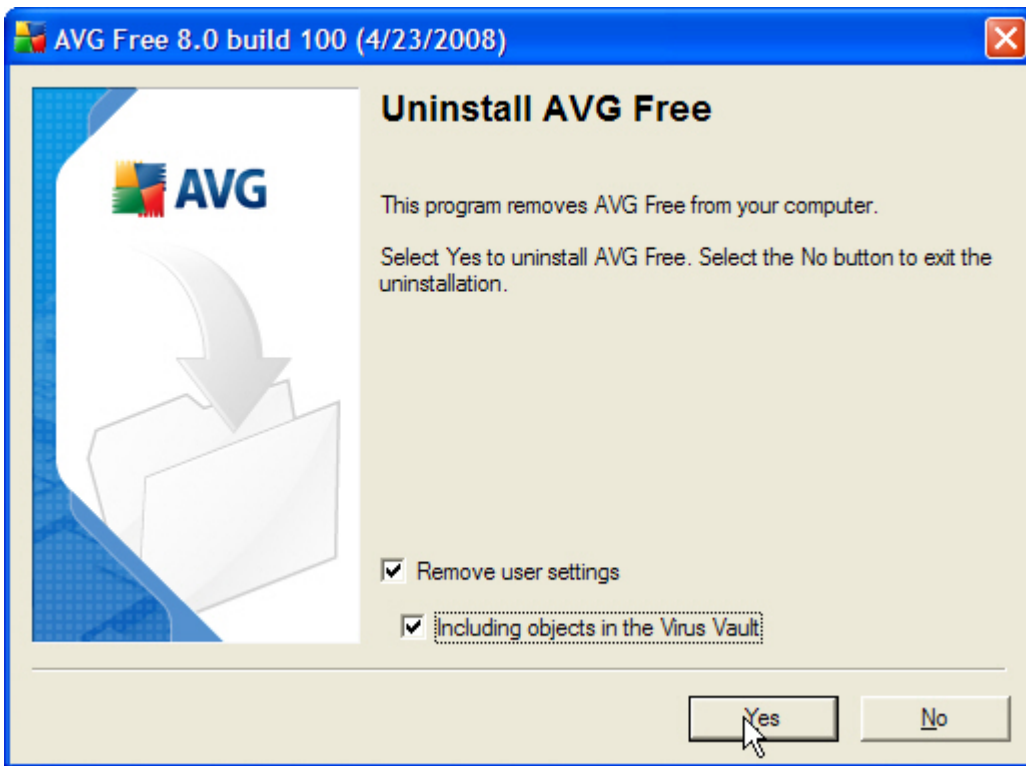

Select **AVG Free** from the list. (You maybe have to scroll down a little to find it depending on what you have installed.) Then click on **Change/Remove Button**.

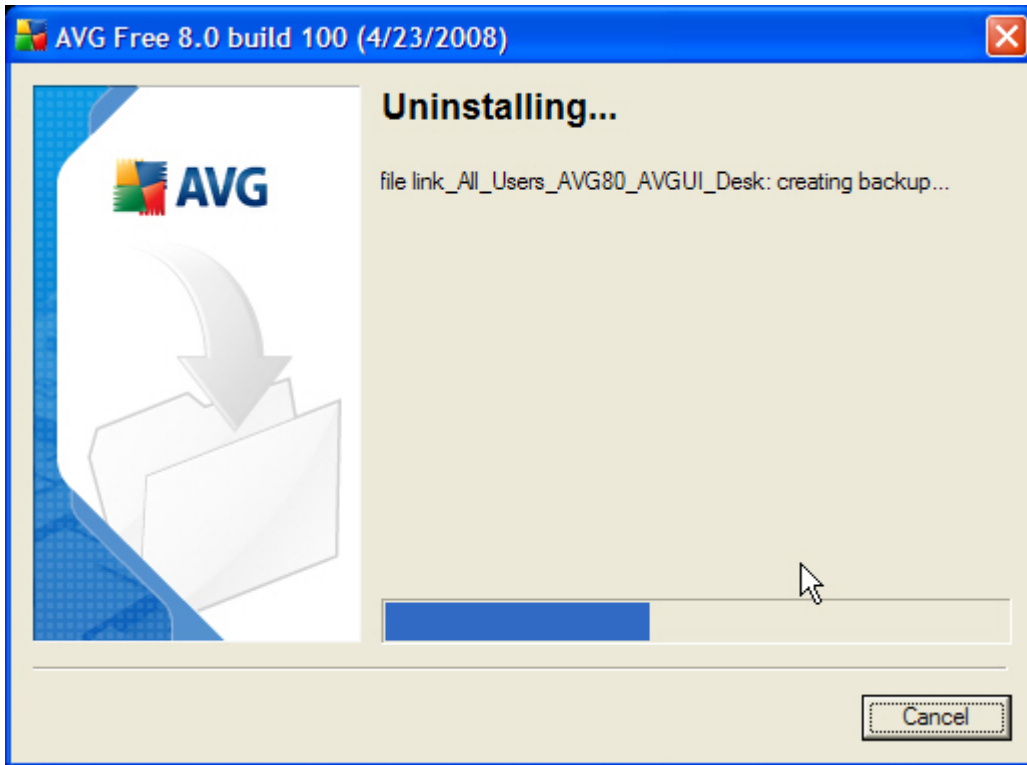

You will get an information screen like this showing some progress.

On the next screen be sure and check **Remove user settings** and **Including objects in the Virus Vault** (you may or may not have these two check boxes. If you don't don't worry about it.)

You will see another progress screen.

You will get this screen once the uninstall is complete.

BE SURE AND LET THE SOFTWARE REBOOT YOUR COMPUTER!!
